

We Protect Your vSAN Volumes

We know that our customers rely on our vSAN solution to support business-critical workloads and they cannot let this data be compromised or lost due to threats like ransomware, malware, human error, etc. That's why our vSAN solution offers our customers state-of-the-art data security and protection measures that ensure high availability and recoverability of mission-critical vSAN volumes.

We protect your vSAN volumes with the following enterprise-grade features:

Immutable Snapshots

With built-in delta-based snapshot utility, create mountable & read-only snapshots that help you recover in the event of a ransomware attack, accidental or malicious deletion, virus infection, and other similar situations.

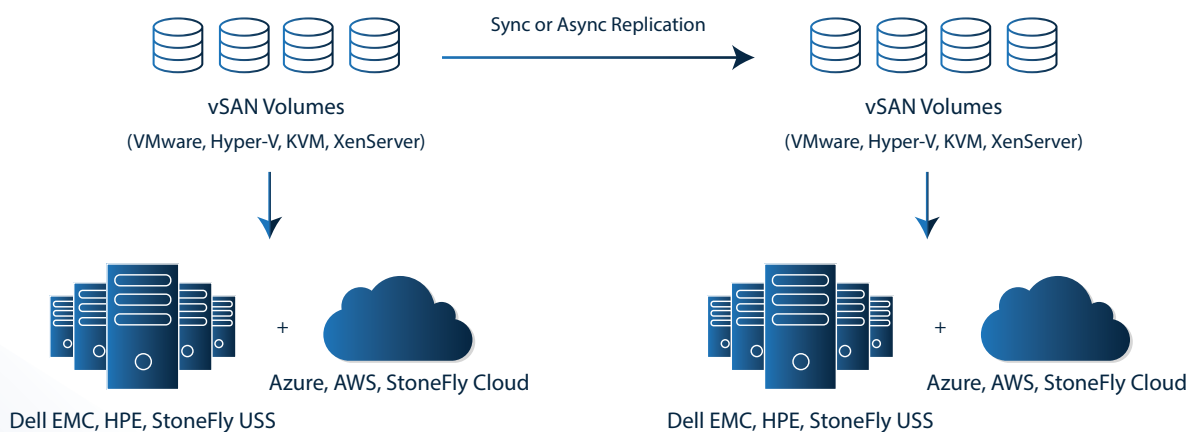

Highly Available vSAN Solution

Multi-Appliance & Multi-Site Replication

Configure real-time replication or asynchronous / scheduled replication jobs to multiple appliances and multiple sites (on-premises + cloud) to support collaborative workloads and to ensure high availability and business continuity.

StoneFly vSAN solution uses built-in automated data integrity checks to ensure the successful completion of all replication jobs. This makes sure that your vSAN is available whenever you need it on all target locations.

State-of-the-Art Encryption

Advanced Volume Encryption

Secure your business-critical vSAN workloads from unauthorized or malicious access with StoneFly's volume encryption capabilities. Our advanced encryption technology ensures your vSAN volumes are safe at rest and when they're being migrated or replicated to offsite locations.
